Introduction

This project will be very useful for internet users because instead of just searching one search engine at a time the user will be able to search several at the same time. In this precollege program that I took this semester I learned that I had to make many searches, so I thought to myself "why not make an application that can make that easier for me?", and that’s when I realized that a meta search engine would be of great use not just to me but to other internet users as well.

Objectives

- Learn the programming language C#.
- In Visual Studio program an application for Windows phone using C#.
- Make the application available to others by putting it in the market.
- With this application help others search the web easier.

Procedures

- Create an algorithm to organize the data in my application's main function.
- Create several search functions for the application
- In Microsoft Expression Blend 4 make the design of the application's look and fell.
- In Adobe Photoshop CS5 create pictures and backgrounds for the application's look and feel.

Tools Used

- Microsoft Visual Studio
- Microsoft Expression Blend 4
- Adobe Photoshop CS5.

App

Conclusion

Programming this application was not easy and it took a lot of work. This experience did not just gave me headaches, it also gave me experience and knowledge. I also realized how interesting is mobile developing and that I would like to do future work in this area. Finally the application was successful.
